

## Experiment 9: Distance Matrix Construction using Various Distance Measures

**Aim: Build a distance matrix for a given dataset using different distance measures such as Euclidean and Manhattan**

### **DESCRIPTION:**

Distance measures are mathematical formulas used to quantify the similarity or dissimilarity between data points. In machine learning and data mining, they are essential for clustering, classification, and pattern recognition.

A **distance matrix** is a square matrix where element  $(i, j)$  represents the distance between object  $i$  and object  $j$ .

Smaller values indicate higher similarity, and larger values indicate greater dissimilarity.

Commonly used distance measures:

1. **Euclidean Distance:** Straight-line distance between two points.

$$d(x, y) = \sqrt{\sum_{i=1}^n (x_i - y_i)^2}$$

2. **Manhattan Distance:** Sum of absolute differences between coordinates.

$$d(x, y) = \sum_{i=1}^n |x_i - y_i|$$

### **ILLUSTRATION:**

Build a decision tree for the following data

Object	X	Y
A	1	2
B	2	4
C	3	5

.

## 1. Euclidean Distance Calculations:

$$d(A, B) = \sqrt{(2 - 1)^2 + (4 - 2)^2} = \sqrt{1 + 4} = 2.236$$

$$d(A, C) = \sqrt{(3 - 1)^2 + (5 - 2)^2} = \sqrt{4 + 9} = 3.606$$

$$d(B, C) = \sqrt{(3 - 2)^2 + (5 - 4)^2} = \sqrt{1 + 1} = 1.414$$

## 2. Manhattan Distance Calculations

$$d(A, B) = |2 - 1| + |4 - 2| = 3$$

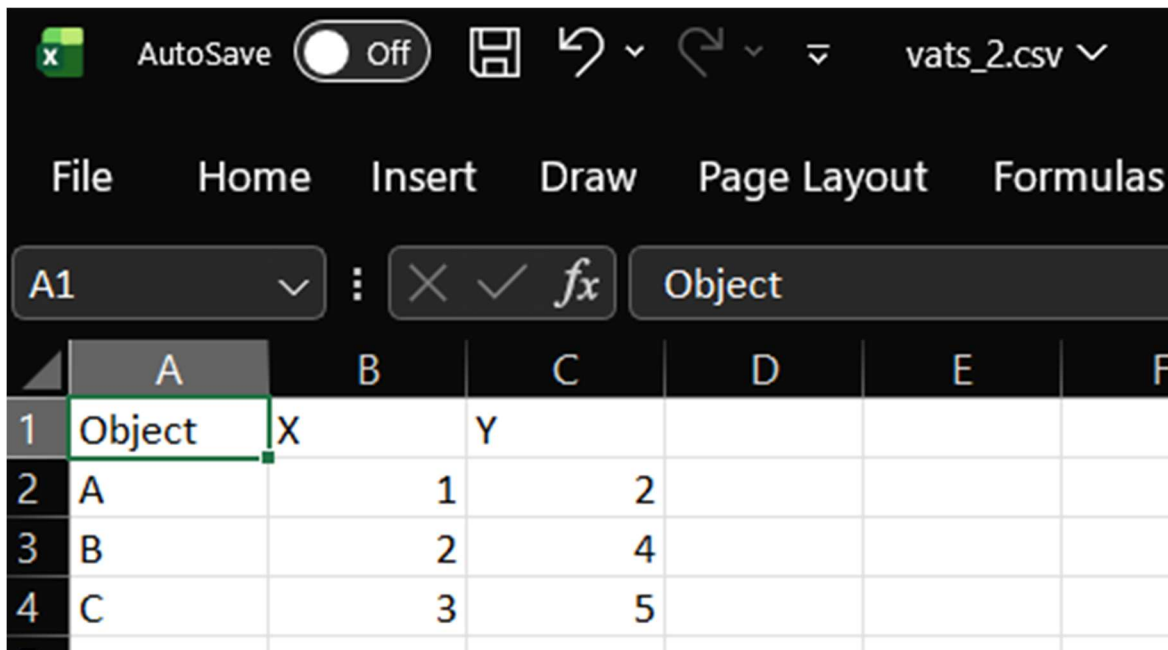

$$d(A, C) = |3 - 1| + |5 - 2| = 5$$

$$d(B, C) = |3 - 2| + |5 - 4| = 2$$

Procedure for running in weka:

### Step 1: Creating the ARRF file

Create the file and type the following data exactly as shown below.

The screenshot shows a Microsoft Excel spreadsheet with the following data:

	A	B	C	D	E	F
1	Object	X	Y			
2	A	1	2			
3	B	2	4			
4	C	3	5			

### Step2:

Open WEKA Explorer → Preprocess Tab → Open File

Weka Explorer

Preprocess   Classify   Cluster   Associate   Select attributes   Visualize

Open file...   Open URL...   Open DB...   Generate...   Undo   Edit...   Save...

Filter: Choose **None**   Apply   Stop

Current relation: **vats\_2**   Sum of weights: 3   Missing: 0 (0%)   Distinct: 3   Type: Nominal   Unique: 3 (100%)

Attributes: All   None   Invert   Pattern

No.	Name
1	<input type="checkbox"/> Object
2	<input type="checkbox"/> X
3	<input type="checkbox"/> Y

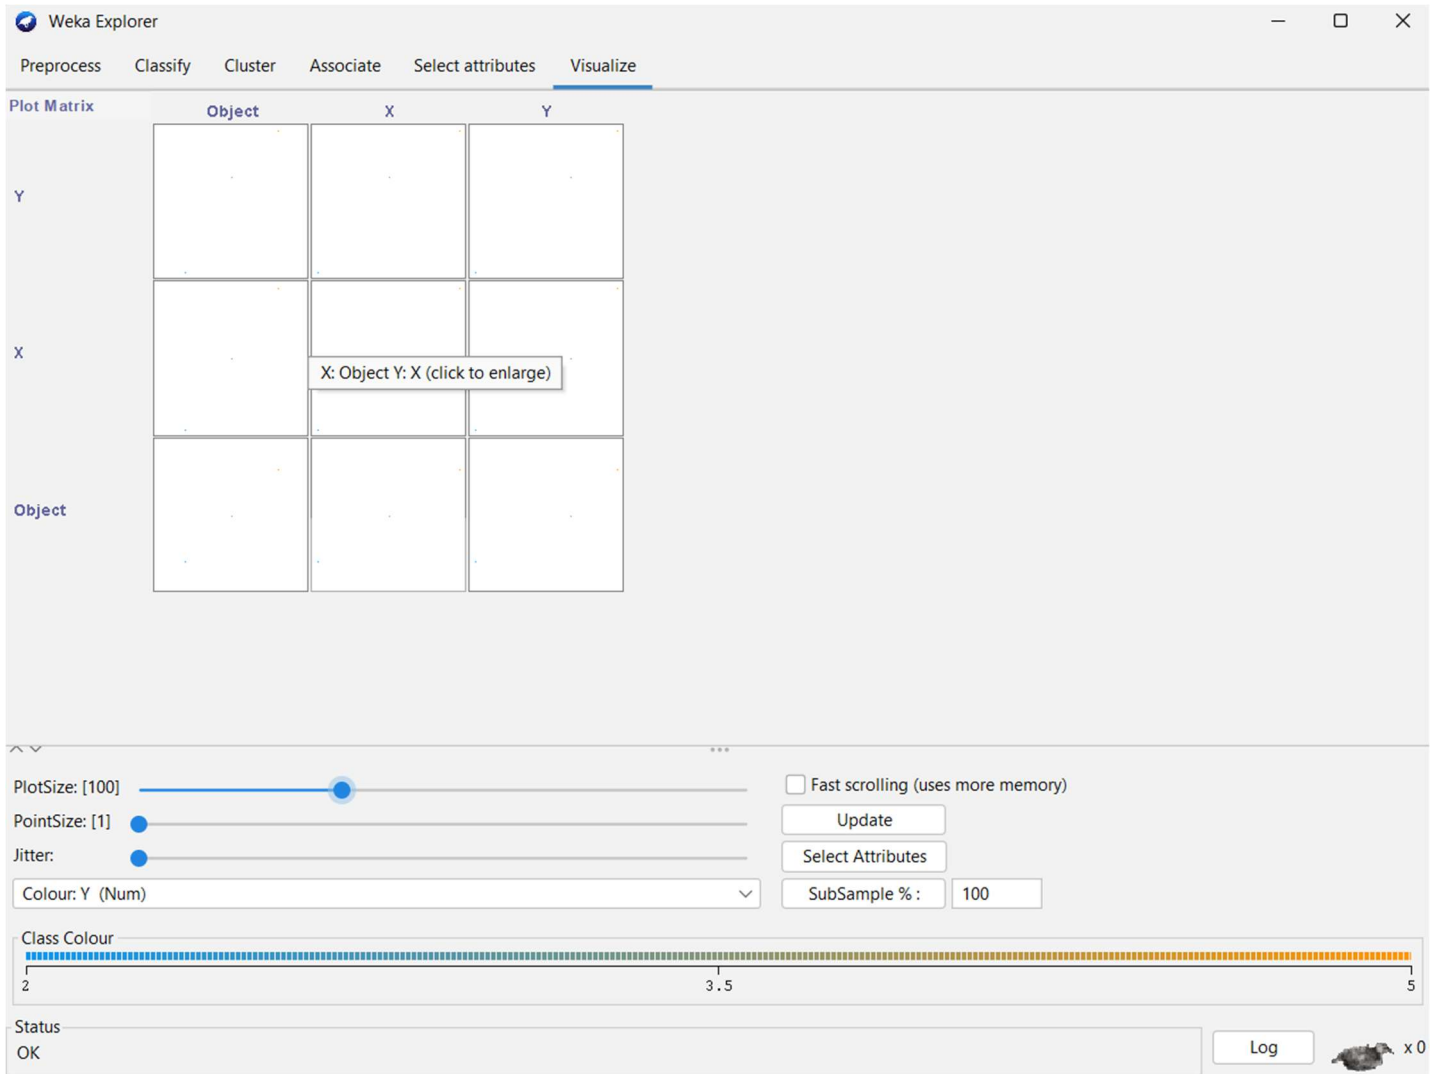

Remove

No.	Label	Count	Weight
1	A	1	1
2	B	1	1
3	C	1	1

Class: Y (Num)   Visualize All

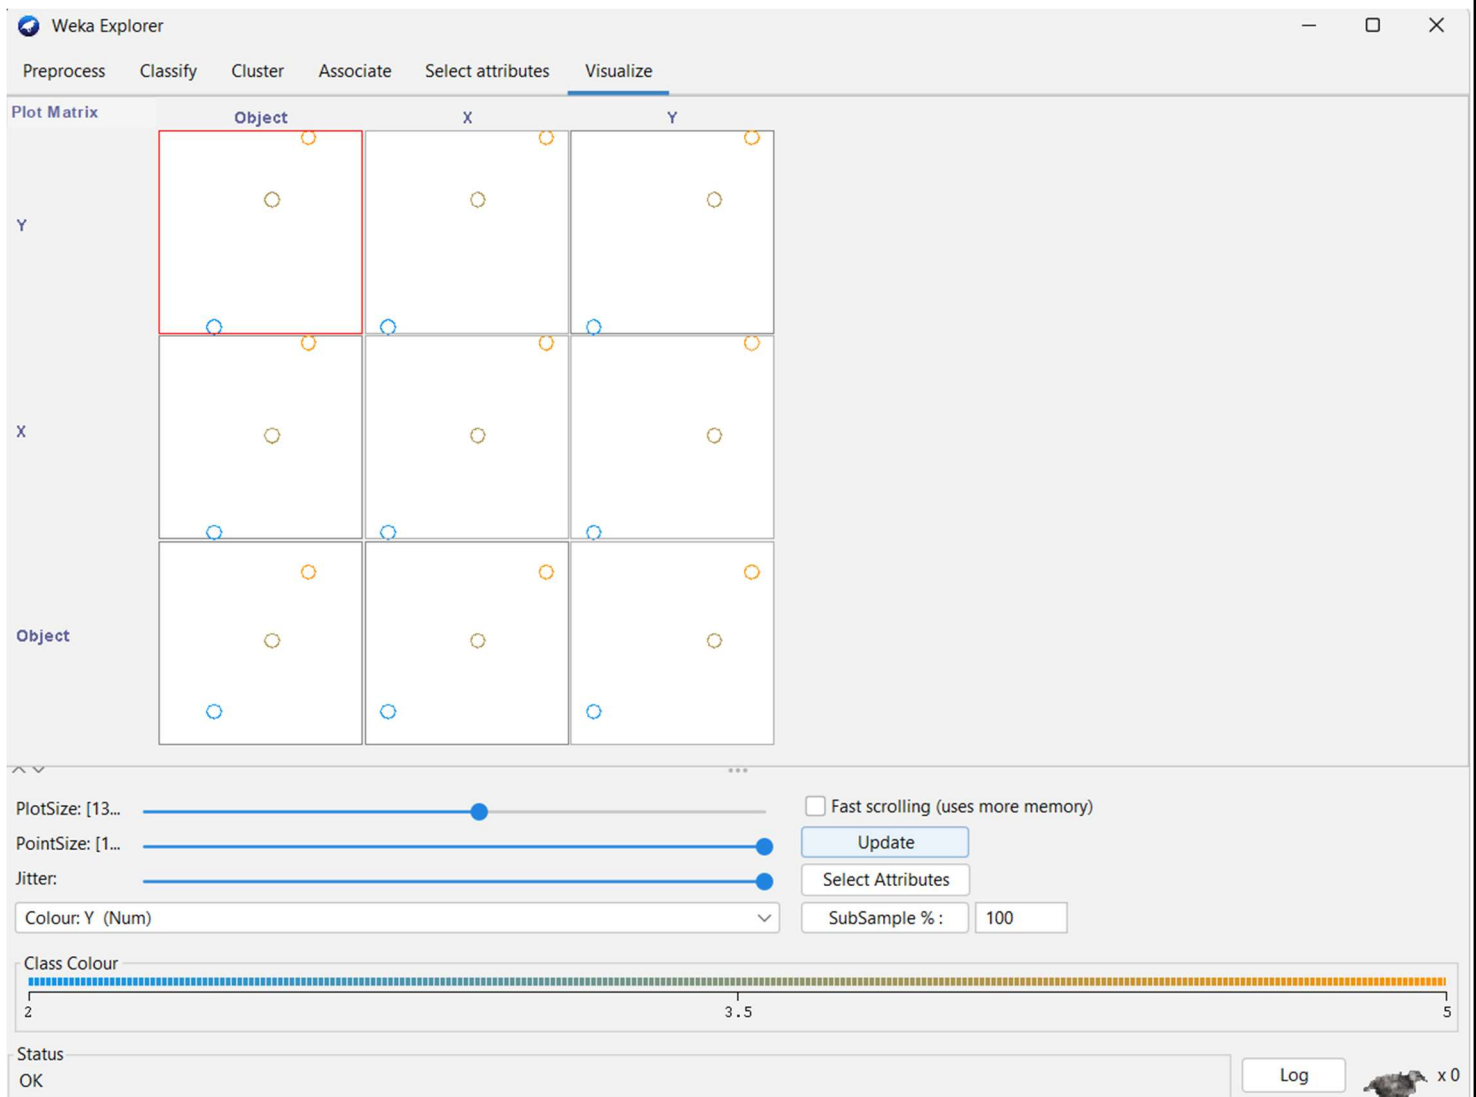

Status: OK   Log   x 0

**Step 3:**  
Go to the **Visualize Tab**

#### Step 4:

Make sure the sliders at the bottom are adjusted as in the image given below:

**Conclusion:**

**From the above we can get the matrices as follows:**

**1) Euclidean Matrix:**

	A	B	C
A	0.00	2.236	3.606
B	2.236	0.00	1.414
C	3.606	1.414	0.00

**2) Manhattan Matrix:**

	A	B	C
A	0	3	5
B	3	0	2
C	5	2	0

**3)**

The Euclidean and Manhattan distance matrices correctly represent pairwise dissimilarities between A, B, and C.

Euclidean measures direct straight-line distance, while Manhattan measures movement along grid-like paths.

Both matrices are symmetric, with diagonal elements equal to zero.

**EXERCISE:**

Add one more data point (D) with coordinates of your choice and recompute both matrices.
